**Division of Cardiology and Catheterization Laboratories, Showa University Northern Yokohama Hospital**

**CASE: A male in his sixties**

**Dx:** Acute Aortic Dissection (AAD)

**Pl:** The patient was admitted with Stanford B AAD and was receiving medical treatments after that. 10 days after his first dissection, he gradually felt left side chest and back pain again.

**PH:** HT, Duodenal ulcer, Ex smoking

**Our EVT strategy**

Stenting from left brachial because celiac artery is directed downward.

Self Expanding Stent will be suitable to avoid stent migration. 3 days after the stenting, the patient’s symptoms was improved.

**Conclusion**

We learnt that a celiac artery ischemia could be a cause of chest and back pain in our particular case.
